Vol 4 No 30

## C128 'price is right' — extras still unclear

COMMODORE has finally announced the UK price for its new C128 micro — £269.

The announcement was made as the micro was launched to the British trade last Thursday, July 18.

Prices for the C128's disc unit and monitor packages are, however, still being kept secret.

The first machines are scheduled to be in the shops by September, but a Commodore source suggested the first machines will arrive in late August.

Commodore is claiming

that the new machine is effectively three micros in one, — a Commodore 64, a 128K machine, and a CP/M machine.

In 64K mode, the C128 emulates a Commodore 64 exactly. It has a 6802-compatible microprocessor, the 8502, a 40 column by 25 line display and runs Commodore Basic 2.0. It has 64K Ram, 16K Rom, and graphics allow 16 colours and eight sprites.

In 128K mode, the machine's Ram goes up to 128K, although only 119.5K is available to the user. 72K of Rom supports the C64 and C128

operating systems and the character generation. Basic is new — version 7.0 — and there is a built-in machine-code monitor. Display capabilities

are either 40 by 25 lines, or 80 by 25 lines.

In CP/M mode, the machine's on-board Z80A second processor is used. *continued on page 4*

ULTIMATE is to release two new titles — *Blackwyche* and *Nightshade*, one each for the Commodore 64 and Spectrum machines — both £9.95.

*Nightshade* will be the first title to use the 'Filmation II' operating system, a development of the games writing environment used to produce Ultimate's successful *Knight Lore* and *Alien 8* titles.

The Commodore 64 title *Blackwyche* continues the adventures of Sir Arthur Pendragon — already seen in *Staff of Karnath* and *Entombed*.

### Acorn MD

ACORN Computers has apparently appointed a new managing director, taking over from Alex Umboldi, Olivetti's trouble shooter.

He is Brian Long, an American, who leaves the Canadian tractor firm Massey Ferguson to join the troubled Cambridge micro company.

An Acorn spokesman declined to comment on the appointment.

INSIDE > DIGIDRUM ON C64 > INSIDE THE BBC'S SPECIAL EFFECTS >

**RED MOON** MoonQuest fantasy adventure for most micros. The Moon Crystal of Xan supplied good magik for the honest rulers of the kingdom of Baskalos. Then it was stolen and the land fell into chaos. You must recover the Moon Crystal from the magik-rich castle where it is hidden, armed only with your wits and spells.

**RED MOON** is a Level 9 adventure with over 200 locations. Amstrad, BBC, Commodore 64, MSX and Spectrum versions have 150+ pictures.

**RED MOON** is available now on cassette at £6.95. It joins Level 9s catalogue of acclaimed adventures for

**AMSTRAD cpc464**

**ATARI 48k**

**BBC 32k**

**COMMODORE 64**

**ENTERPRISE 64**

**MEMOTECH 500/512**

**MSX 64k**

**SPECTRUM 48k**

Here's what some reviewers have recently said about Level 9.

"the series of adventures which has (since) flowed from Level 9 is renowned for high standards of plot and literate description".  
-Sinclair User, May 1985

"I'll be kept more than busy by the absorbing Level 9 adventures".  
-MSX User, June 1985

"If only more adventure houses could achieve Level 9".  
-Crash, May 1985

So don't forget our other great adventures:

**COLOSSAL ADVENTURE**† (cass £9.95) The classic mainframe game with 70 bonus rooms.

**ADVENTURE QUEST**† (cass £9.95) "A brilliant adventure that confirms Level 9's place as the ultimate adventure software house" -Computing with the Amstrad, May 1985.

**DUNGEON ADVENTURE**† (cass £9.95) "A wonderful adventure...a world where electric bills and mortgages have no place" -MSX Computing, June 1985

**LORDS OF TIME**† (cass £9.95) An imaginative romp through world history.

**SNOWBALL**† (cass £9.95) Immense science fiction game with 7000+ locations.

**RETURN TO EDEN**† (cass £9.95) Popular SF adventure. Amstrad, CBM64, MSX and Spectrum versions have 240 pictures.

**EMERALD ISLE**† (cass £6.95) Fantasy adventure. Amstrad, BBC, CBM64, MSX and Spectrum versions have 230 pictures.

**ERIK THE VIKING** (cass £9.95) Game of Terry Jones' book for Amstrad, BBC, CBM64 and Spectrum only. All with 180+ pictures.

Level 9 adventures are available from all good computer shops. If you can't find the game you want please ask them to order it.

You can also buy games directly from us. Just send us a cheque made payable to Level 9 Computing, or a postal order. Don't forget to tell us your address, which computer you have and which game you'd like. (Add £1 for each item if outside the UK.)

If you would just like a **FREE FULL COLOUR POSTER**, with more details of Level 9

Adventures on the back, please write to us enclosing a stamped, self addressed envelope at least 9" by 6". Write 'POSTER' above our address.

Please write to

## EDITORIAL

Just who is going to buy Commodore's new C128? On the one hand Commodore seems to be pushing the machine as the natural successor to the Commodore 64. On the other, the company is anxious to dispel concern among its distributors that the machine may take sales from the C64.

The basic console alone - at £269 - is nothing more than a very expensive way of buying a Commodore 64. To use the micro to the full in C128 mode - and resolve the mode's 80-column display - you need to buy either of Commodore's two monitor units. No price has been announced for the monitors, but the cheapest is likely to cost around £150. To use the micro in CP/M mode and be able to use the range of often expensive disc software available under the CP/M operating system, you need Commodore's 1571 disc unit - maybe another £150. Do you want the mouse as well? That could cost perhaps another £75. All in all, you could spend nearly £700 to make the most of your C128.

Depending on your viewpoint, the C128 is either a £260 micro that can

grow with you as your expectations increase. Or it is a £260 micro which only operates at a third of its potential.

I am inclined to think that manufacturers like Commodore, Atari, Sinclair and now even Amstrad are misjudging what people want. There doesn't seem much doubt that any 'quantum leap' in home software (predominately entertainment programs) means fast complex graphics animation. That in turn means 16-bit (unlike the C128) with lots of memory. But it doesn't necessarily have to mean discs and monitors.

At £199 stripped-down 256K 68000 machine, determinedly running cassette-based software linked to an ordinary cassette player and configured to work with an ordinary colour TV, would probably do well.

The Spectrum was always bound to out-sell in units the Commodore 64, and the Commodore 64 the BBC. Simply because of price.

The same philosophy will hold true for the new generation of home micros. It is a mistake for manufacturers to make expensive features like discs and monitors essential. Instead, they should be optional extras.

Computer Trade Association Magazine of the Year

# Schools go for CPCs

AMSTRAD's attack on the Acorn-dominated schools micro market is achieving some success with sales so far to more than 15 local education authorities.

Northern Computers, a Warrington-based company which was appointed sole educational distributors by Amstrad some nine months ago is selling machines at a discount to schools and educational authorities throughout the UK.

The disc-based Amstrad CPC 664 with green screen monitor sells to educational authorities at £279, and the

colour monitor version sells for £369. In addition, Northern Computers is bundling £200 of educational software with each machine.

According to Northern Computers director Gareth Littler, "Amstrad appointed us sole educational distributors, and we set up the Amstrad Educational Scheme, which has been gathering momentum ever since."

Schools have been buying both the 464 and the 664, but Gareth Littler said, "The 664 overtook the 464 almost immediately it was made avail-

able to educational authorities."

Northern Computers has also designed a ring network system which can handle up to 122 micros per ring. It can be used to link Amstrad 464s, 664, BBC Bs, Apricots, Apples and IBM PCs.

The first network to be installed by Northern Computers will be at the Bootle High School, which comes under the Sefton Educational Authority. The planned network will include 18 Amstrad 464s.

The network interface includes a built-in 280 microprocessor, and sells for £125 per computer to educational authorities.

According to Louis Melis, the man in charge of the Amstrad sales office at Northern Computers, the peak period for sales to educational authorities is March, when all the cash remaining in the year's education budget must be spent or lost.

"We were moving between six and 12 Amstrads a day last March. This year we are aiming at 100 per day in the Christmas period and

Ray Kulag, managing director of Compustore, one of London's leading Commodore dealers, said simply "The idea is right, and the price is right."

Buyers for the big chains, such as WH Smith, John Menzies, Boots and Laskys, were unwilling to commit themselves, however.

A Laskys' spokesman said: "I would imagine that we probably will be taking it - but we have until September to decide."

Both John Menzies and WH Smith are still in negotiations with the major computer manufacturers - until those discussions are concluded no decisions will be made.

## 1350 mouse controller

## C128 launch

continued from page 1

and microprocessor allows the user to run a wide variety of business software.

To fully utilise the extra features of the new machine, however, purchasers will also have to buy a monitor and the new 1571 disc drive.

While the C128 has RGB, RF, and video outputs without a monitor, users cannot display 60 columns. Commodore recommends either its 1900-C colour monitor, or 1900-M monochrome monitor.

While the C128 will work with the existing 1541 disc drive perfectly well in 64K mode, Commodore is recommending the new 1571 disc drive to C128 purchasers. The 1571 will apparently emulate the 1541 when the micro is in C64 mode, but in 128K mode it works faster.

In CP/M mode, the 1571 disc drive can read discs formatted for other, non-Commodore, business machines, including those produced by IBM, Kaypro and Osborne.

Commodore was not revealing prices on the 1900-C and 1900-M monitors, mouse or 1571 disc drive at the

launch. Dealers were being informed that the uncertainty of the rate of exchange between dollar and pound was to blame for this, although the same uncertainty did not affect Commodore naming a price for the micro itself.

## 1900-M monochrome monitor

Some indication of UK prices to come can be seen in the US prices. In the US the C128 sells for \$349.95, (about £269), the 1571 disc unit is

## 1900-C colour monitor

\$299.95 (about £230) and the mouse is \$49.95 (about £39).

Most of the dealers present at the launch of the C128 seemed to feel that £269 was a very competitive price, even though the prices of the monitors and the disc drive were not available.

## 1571 disc drive

next March."

He suggests that one reason some schools were turning to Amstrad was that "they are having difficulty getting new BBC Bs."

In addition to the network and associated products, Northern Computers has also produced an implementation of BBC Basic which runs on the Amstrad machines, which has increased the machines' appeal to schools.

## Compunet slings MUD at BT

COMPUNET, the Commodore dedicated networking system, is to open up its version of Multi User Dungeon to non-Commodore 64 owners in August, bringing it into direct competition with British Telecom's MUD system to be launched a month later in September.

According to Compunet's Alan Carmichael, to play MUD on Compunet, the user's micro is effectively phased out of the Compunet system and becomes a 'dumb terminal' for the host main-frame. In future, owners of any micro with a modem operating at 1200/75 baud rate, and terminal emulation software (usually included in the programs needed to run a modem) will be able to by-pass the main Compunet system and enter MUD direct.

Compunet is also introducing new charges for MUD. Players will pay a certain amount per month, and then an hourly rate which varies according to the monthly payment opted for - if the subscription charge is fixed at £5 per month, the player will pay £2.50 per hour; but choose to pay £25 per month, and the hourly rate drops to £1.75.

"The hourly rate includes all network charges - and because Compunet already has access points across the UK, the phone bills are cheaper too," said Alan Carmichael.

● British Telecom's competing enhanced version of MUD, will be open to users with modems which operate at both 1200/75 and 300/300 baud rates (see *Popular Computing Weekly*, July 18).

## Beyond the pond

BEYOND has licensed three of its games to Mindscapes, the American software house.

The three games involved are *Lords of Midnight*, *Shadowfire*, and *Quake -1*, the last of which has yet to be released in the UK.

The Beyond brand label

will be given equal prominence to the Mindscapes logo. Clive Bailey, Beyond's marketing manager, claims that Beyond is "the first company to licence a UK game to the States on its own terms, preserving its own brand name".

## FAST action

THE COPYRIGHT (Computer Software) Amendment Bill completed its final stage in Parliament on July 5, and received Royal Assent - the final stage making the bill

law - on July 16.

The so-called FAST Bill, named after the industry lobby group Federation Against Software Theft, extends copyright protection to all computer software, thus ending the loophole in the law which effectively allowed pirates to get away with stealing programs.

Under the revised 1957

Copyright Act anyone guilty of breaching copyright on computer software - through unauthorised manufacture, translation or sale - can be fined up to a maximum of £2,000 per offence and imprisoned for up to two years. The new penalties come into force in mid-September.

Previously, the only legal actions that have succeeded against piracy revolved around documentation or music, both of which are copyright protected.

As the bill became law the Federation Against Software Theft announced it has appointed an Enforcement Coordinator - former Chief Superintendent Bob Hay - to act as a focal point for copyright enforcement activities in the software industry. Bob Hay, who retired from the Metropolitan Police force in June this year - commented, "It is FAST's objective to ensure that companies and enforcement agents are not working in isolation. We are already working to build up a database of facts to facilitate complete cross checking."

## Sinclair deal is still on

**SINCLAIR** Research has scotched press speculation that the rescue deal between a Maxwell subsidiary, Hollis, and the ailing micro manufacturer is in trouble.

"The takeover should be completed by September," said a spokesman. "But when one of the companies involved in any such deal is listed on the stock exchange, as Hollis is, there are strict rules of practice that must be followed, and these take time," he continued.

## Activision

ACTIVISION has now appointed its new UK managing director to fill the gap left by Geoffrey Heath's departure to Melbourne House.

The new chief will be Hugh Rees-Parnall, 35 years old, and sales and marketing manager at RCA/Columbia Pictures Video UK prior to the Activision post.

## Growing up

I agree with much of Brian Walthams letter, (July 11 issue), but I don't think the present way the computer industry is 'growing' can be described as 'up', nor is it particularly healthy.

The industry is undoubtedly contracting and in so doing, unfortunately it seems to be the manufacturer with the biggest and best games machine, or the software house with the newest arcade games program that seems to be surviving.

I say unfortunately, because I have never seen what all the fuss involving computer games is about. Surely computer games and for that matter those who play them, bear little relevance to computing (home or otherwise) and have a closer affinity to

those who enjoy *Snakes and Ladders*, *Ludo*, *Mousetrap*, or any one of a number of similar board games: The additional 'sophistication' brought about by playing games on a computer rather than a playing board, is a benefit of the medium on which the game is played and the skill of the programmer, nothing else.

There is nothing clever about punching a few keys or manipulating a joystick to play a game, it contributes nothing to the computing knowledge of the player. Those who seek to justify the fact that they still indulge themselves in the childish activity of playing games, by calling it 'home computing' are fooling nobody but themselves.

It can be argued that but for the massive games market, the cheap home computer

would not exist. But, equally, the present contraction in the market is due to many of those former games players growing out of their toys, as they did with CB radios, and moving on to something else.

One can only hope that some of these, instead of growing out of their toys, grow up with them and realise that there is a lot more to computing than zapping aliens, camels, ghosts and rampaging toilet seats.

## Revised version

A small fault has recently been brought to my attention in my Amstrad program *Statement of Account* giving a subscript error report. It is caused when collapsing the arrays dealing with Standing orders and Special expenditure sections. If lines 11250 and 14580 are replaced with the lines below and the program is re-saved there should be no further problems.

```
11250 FOR k=0 TO
1: a$(pa,k) = "" : a(pa,k) = 0:
NEXT: g$ = "Q"
14580 FOR n=x TO
ct: ct$(n) = ct$(n+1):
spend(n) = spend(n+1):
NEXT: ct$(ct) = ""
"spend(ct) = : ct = ct-1: GOTO
14060
```

Readers who sent for the program on cassette have either been contracted or have been sent revised versions.

## Super computer?

Popular Computer Weekly's news section has recently been describing the Atari ST as a super computer that's very much better than the QL.

I do not believe this to be the case. The difference in external buses of the microprocessors only increases speed by 30% and when you consider that the ST's operating system is written in a compiled high-level

language and that the Rom is accessed two bits at a time, it looks as if the ST could actually be slower than the QL.

Also the original 192K of internal Rom has been reduced to 16K. This presumably means that 176K of language and operating system must now be loaded into the machine for disc before use.

The machine lacks the structured basic of the QL and to some extent the BBC computer, although the other languages provided may compensate for this.

All of this taken together with the complete lack of software makes the Atari ST compare unfavourably with an equivalent QL system.

Barry Adams  
77 Twyford Abbey Road  
London NW10

## Biased comments

I have just read your editorial in the July 4 issue, and I must protest about your final comments.

I refer to the comment: "to begin with, the top Spectrum software will knock spots off its ST rivals".

The top Spectrum software can't knock spots off the Atari 8-bit software, let alone the insult of comparing the Spectrum to the ST. It's like comparing a beat-up old Mini with a brand new Rolls. You couldn't even truthfully make a comparison between the sawn-off QL and the ST.

You are so biased towards the Spectrum, I'm surprised you don't call the magazine *Spectrum Computing Weekly*.

## Micronet competition

This is the fourth and final clue in the competition to win free 30 memberships of Micronet and Prestel held in conjunction with Thames TV's *Database* programme and Micronet 800.

When, using the solution to this last puzzle, in conjunction with the previous puzzle answers, you think you have found the overall solution to the competition, you should send it to the address below. Closing date is Friday 18th August 1985. Entries to: Micronet Visicode Crossword Competition, Durrant House, 11 Herbal House, London EC1R 5EJ.

### Final Clue

#### Part A

"The Cobb has invited what familiarity breeds for at least seven hundred years, and the real Lymars will never see much more to it than a long claw of old grey wall that flexes itself against the sea. In fact, since it lies well apart from the main town, a tiny Piraeus to a microscopic Athens, they seem almost to turn their backs on it. Certainly it has cost them enough in repairs through the century to justify a certain resentment. But to a less tax-paying, or more discriminating eye, it is quite simply the most beautiful sea-rampart on the south coast of England. And not only because it is, as the guide books say, redolent of seven hundred years of English history, because ships sailed to meet the Armada from it, because Monmouth landed beside it... but finally because it is a superb fragment of folk-art. Primitive yet complex, elephantine but delicate; as full of subtle curves and volumes as Henry Moore or Michelangelo; and

pure, clean, salt, a paragon of mass. I exaggerate? Perhaps, but I can be put to the test, for the Cobb has changed very little since the year of which I write..."

#### Part B

"At the Great Norman Abbey circa 305, The first Christian martyr, and namesake, died, Running through the town is the River Ver, Past the excavated ruins on view there."

# Fairlight

chronicles of the land of fairlight  
I. a prelude: the light revealed

BY BO JANGEBORG

(author of 'The Artist')

There are some people who believe that Ultimate's *Knight Lore* and maybe *Alien 8* are the — well the ultimate Spectrum games. That we can go no further. But we've seen something that makes Ultimate's system look very limited indeed. The first example of it will give the Spectrum a whole new lease of life. The second example should take a lot of flash software houses out of it at a stroke.

COMPUTER TRADE WEEKLY Monday June 3 1985

The first example of the revolutionary 3D "Worldmaker" technique

# L.A. T.O. N.Y.

## Round one

**Program Rocco Price £7.95**  
Micro Spectrum 48K Supplier  
Gremlin Graphics, Alpha  
House, 10 Carver Street, Shel-  
field S1 4FS.

**F**ar be it from me to suggest that boxers are all bone-headed, bludgeoning, body-crunchers... after all, they're bigger than I am! However, I have no hesitation in stating that the average computer user is unlikely to go three rounds with my kid sister let alone the Boston Bruiser.

Until now the only way out was via Charles Atlas, but at last here's an alternative, the opportunity to beat your opponents to a bloody pulp in the privacy of your own

series of increasingly heavy and brutal pugilists. Your view is from just above your boxer's head and the large animated figures are excellent, as is the cheering crowd in the background. There are only four controls - attack/defend, left/right - but nobody ever suggested that boxing was intellectually challenging.

Well, I went a few rounds, pulverising early opponents until somebody gave me the old one-two and I went out like a light. But something was missing. I know my trainer told me to stand my ground but I was rooted to the spot. In fact, without movement I felt decidedly starved of options.

Though it takes skill to judge timings I doubt the last-ling attraction of this game, even though it provides the opportunity to get hammered

home. No weight training, no unpleasant exercise and you can retain that much sought after physique of a seven stone weakling.

As Rocco you take on a

without the risk of dislodged teeth, a broken nose and brain damage.

John Minson

## Balanced

**Program Compiler Price**  
£34.95 Micro Amstrad Sup-  
plier HiSoft, 180 High Street  
North, Dunstable LU8 1AT.

**T**he manual for this version of C, which incidentally far exceeds the already high quality of HiSoft's documentation, begins with the comment that this is one of the most important products yet released for the Amstrad. And they may not be far wrong.

C is the language that is

receiving the most attention in business software circles at present. Whilst originally designed for systems programming giving low-level access to the hardware, it has enough high-level features to make it relatively painless to produce a wide range of software.

The language manages to strike a balance between speed and efficiency, flexibility and ease of use. This is not to say that it makes immediate sense to someone familiar only with Basic. Part of the power of the language is that very concise shorthand coding can be used which pro-

## Psychopathic

**Program Glass Price £7.99**  
Micro Spectrum 48K Sup-  
plier Quicksilver, Liberty House,  
222 Regent Street, London  
W1R 7DB.

**T**his is not just a shoot 'em up, this is a psychopathic bloodbath! Round after round of lasering anything that moves and/or shoots at you precedes reaching the city and nuking it! Then there are two more cities to blast to atoms before it's time to go home for dinner and an evening watching telly.

As a respite from this wholesale slaughter, you have to steer, at mind warping speed, between the sort of tower blocks that Prince Charles dislikes so much (sadly you can't blast or bulldoze these). It really is quite exhilarating, though collisions do the sort of shield damage that loses your no-

claims bonus. There are also fly pasts of space fleets to admire.

The graphics are excellent, both in large scale and animation, and in the movement over the planet surface. As far

as appearances go it's a real good looking Glass (ho, ho, ho!). You can also pick up where you died, though you can't carry over your score.

In the end the game could prove rather thin, except to the aforementioned carnage merchants. You see, once you look beyond the graphics you realise there's not really that much game on the other side of the Glass.

John Minson

duces fast programs, but makes Basic look positively verbose.

Aside from the library functions, C is one of the most clearly-defined languages. Whilst HiSoft's C has some minor variations from the standard these rarely restrict the capabilities of the language, rather the way things are expressed. The only notable omission is that there is no ability to handle floating-point numbers - not an uncommon limitation on small micro C's - and the manual hints that an up-grade including this may appear.

To get round some of the interrupt and sophisticated keyboard scanning facilities of the hardware (which made HiSoft's Pascal run slower on the Amstrad than on the Spectrum) it has had to sacrifice the facility to make a controlled return to Basic either from the compiler or from stand-alone compiled code.

Still these are minor problems and the chance to gain experience of the language in your own home is something no aspiring 'serious' programmer should miss.

There are relatively few primitive keywords that come as standard with the

language. These are based around file handling, since the original use of the language was to develop operating systems such as Unix, and are used as building blocks for more advanced routines with the screen, printer, etc, treated as special 'files'. You are inevitably also provided with a library of pre-defined functions such as *putchar* for writing to the screen and some of these are so traditional they are now standard.

As with its Pascal, HiSoft has provided an extended library that gives simple access to the hardware features of the Amstrad - graphics, sound and disc/cassette handling in particular. Although it will not be the most efficient way to write in C you are given every possible help to make it easy to reproduce your Basic programs at a compiled speed.

It may not be for beginners - there is much more scope for spectacular errors to be made from C than Basic or Pascal - but of all the languages I have seen on the Amstrad none has impressed me as much as this.

Tony Kendle

## Premium bond

**Program** *A View To a Kill*  
**Price** £10.98 **Micro** Spectrum  
48K **Supplier** Domark Ltd,  
204 Worple Road, London  
SW20 8PN.

**T**ake a look at this, 0032 (inside leg measurement)."

"It's a computer game, sir."

"And?"

"Good Lord, isn't that 007?"

"Exactly! His latest mission, supposedly Top Secret."

"It isn't a very good likeness."

"It has about the same range of expressions. I think you should investigate."

"Gosh, I like this title sequence... just like one of his films. By the way, why do you let him do those?"

"Government cutbacks. We get a percentage of the profits."

"I'm in Paris now, driving round a maze of streets, trying to intercept a parachutist. Am I driving a dodgem... I

keep on bouncing off walls? Now I'm caught in an endless loop. I can see why he's so highly rated. It's infuriating."

"To the point of dullness."

"I'll skip ■ City Hall, San Francisco. Oh dear, the place is on fire. How do I get out of here?"

"That's for you to discover. Use the 'duck-shoot' selection system to search, use objects and other adventure options before you get too hot under the collar."

"This is cooler. I'm in the mines. How athletically I leap."

"Better look first. Now you're trapped at the bottom of a pit."

"Oh, it's not quite the pits."

"But will it jeopardise security?"

"I doubt ■ will hold much attraction except for those already in the know, sir - especially ■ this price."

"Considering the number who've seen the film that's an awful lot, isn't it, '32?"

**John Minson**

## More myths

**Program** *Dun Darach* **Price** £9.95 **Micro** Amstrad **Supplier** Gargoyle Games, 74 King Street, Dudley, West Midlands DY2 8OB.

**T**here can be few people who have not heard of this 'prequel' to the superb *Tir Na Nog*. The story concerns the early adventures of Cuhulainn who has had his charioteer kidnapped by an evil sorceress and held captive in the mysti-

cal city of Dun Darach.

You control the main character through scores of subquests on the route to his final goal, attempting to decipher the meaning and use of the various symbols and objects lying around. As has been said many times it is the closest yet seen to a true fully-animated and interactive graphics adventure.

One advance over *Tir Na Nog* are the interactive characters - there are about ten other characters with whom you must trade and swap objects to receive clues and items necessary for your suc-

## QL Leap

**Program** *Hopper* **Price** £14.95 **Micro** Sinclair QL **Supplier** Microdeal, 41 Truro Rd, St Austell, Cornwall PL25 8JE.

**W**hat can I say, yet another from the Steve Bak/Microdeal stable - *Hopper*, it's not very hard to guess that it's a *Frogger* type game for the QL.

For the uninitiated few the idea is to leap a frog; first, across a busy road (trying to avoid getting squashed in the process), to the river bank, and then across on a variety of moving logs that keep disintegrating. The game has three levels, the easiest stage is just cross the road and the river, the second stage adds a

snake as well, and in the final stage you have to avoid both the snake and a crocodile that haunts the frogs home base.

Everything that can be said about *Frogger* clones has been said; the scrolling is smooth (as we've come to expect from Microdeal) the cars look like cars, the trucks look like trucks, even the river looks like a river and it's just hard enough to cross the road and the river to remain a challenge.

It seems bizarre ■ find so simple a game on so sophisticated a machine and at £14.95 it's not a cheap game by Spectrum/CBM 64 standards, but, within the QL market it's a reasonable price for a reasonable piece of software.

**David Storton**

cess. Each of these have certain traits, likes and dislikes which have to be divined. The monetary system is also central to the game - you can buy and sell, steal objects, invest, gamble or even work to make some readies. My initial reactions to the game were not all favourable - trading to build up capital seemed tedious and the evil Greg Follis of Gargoyle had given so little away in the blurb that the first hours were spent seedling with frustration and bafflement.

Then I stumbled upon a method of clocking up thousands in cash and solved the mysteries of the galleries and I now find I have reached a

dangerous level of fascination with the game - food, work, whatever all take second place. Beware of this program!

This ■ the last in the Celtic Myth series planned from Gargoyle and it stands head and shoulders above 99% of the other releases for the Amstrad computers and although it only took ten days to convert from the Spectrum, they are studying the market before deciding whether to release *Tir Na Nog* as well.

Make it a success, pester them to death and we may persuade them.

**Tony Kendle**

## All fall down

**Program** *Catastrophe Price* £8.95 **Micro** Amstrad **Supplier** Amsoft, Brentwood House, 169 King's Road, Brentwood, Essex, CM14 4EF.

**T**his would have made a very good cheapie game. It is rather addictive with very smooth

graphics and tend to blow down. You compete against the clock against a computerised player doing the same.

Unless you have a joystick, or intend to buy one, don't touch this game with a bargepole because it is certainly not worth a combined price of about £20.

The problem is that, whilst strictly speaking it is not 'joystick only' so you can't ring up Amsoft in righteous fury

graphics but there isn't much to the plot with only one screen and only one basic idea that goes on getting a bit harder each time.

You must control a helicopter which is building something or other on an island in a bay - it all looks something like Alcatraz to me. Large building blocks appear on the top of a boat, you lift them off, drop them into position, get another one, etc. Hazards include low flying aircraft, tornadoes, earthquakes, etc. You get a bonus for completing a tower so the temptation is to build tall and thin but these structures are less sta-

ble and tend to blow down. You compete against the clock against a computerised player doing the same. Unless you have a joystick, or intend to buy one, don't touch this game with a bargepole because it is certainly not worth a combined price of about £20.

The problem is that, whilst strictly speaking it is not 'joystick only' so you can't ring up Amsoft in righteous fury for them not putting a warning on the box, most owners will already know the keys that duplicate the joystick signals on the keyboard form an absolutely unplayable finger tangling combination. You have been warned.

It is the sort of thing that if you got as a present you may find is surprisingly enjoyable and playable but it is far from being a landmark in software history - and isn't it time Amsoft began to do something about their games pricing!

**Tony Keadle**

## New seekers

**Program** *Morden's Quest Price* £8.95 **Micro** Commodore **Supplier** Melbourne House, 39 Milton Trading Estate, Abingdon, Oxon OX14 4TD.

**F**or their latest C64 game Melbourne House has decided to follow the traditional text-only adventure format. Written by the author of their *Classic Adventure*, *Morden's Quest* certainly contains all

the qualities one associates with a good adventure.

At the beginning, you find yourself in a strange bedroom inside a large mansion. After a bit of exploring, you come across Morden himself. With two screens of text he briefs you for your mission - to bring him the lost components of his precious immortality machine. Failure means the destruction of the universe.

As with all good adventures, the text oozes with colourful adjectives which help to create an authentic atmosphere.

## Hide and seek

**Program** *Finders Keepers Price* £1.99 **Micro** Commodore 64 **Supplier** Mastertronic, Park Lorne, 111 Park Road, London NW8 7JL.

**T**omorrow is the princess's birthday and the king has no idea at all of what to get her for a present. At least, so we are told in the blurb for the C64 version of Mastertronic's successful Spectrum title, *Finders Keepers*.

Being one of his magic knights, you have been ordered to find a very special gift. With this in mind, you are transported to the Castle of Spriteland which is teeming with many weird and wonderful creatures.

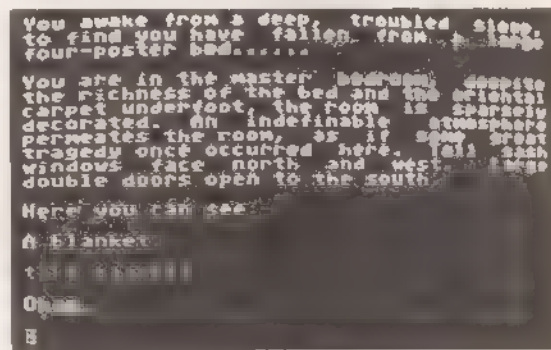

Two courses of action are available. You can either do

the dirty on the king by collecting treasure and escaping, or you can return the treasure to the king who, in his infinite gratitude, will make you a member of the famed Polygon Table. Which will you choose?

*Finders Keepers* is another one of those platform creations, with loads of garish colours and hundreds of sprites, but it also contains some novel features. Along with the normal joystick controls, you can also pick up, drop, examine and trade objects by using the keyboard. Joining the chambers of the castle are two fairly large mazes - both take a bit of solving.

I can't say that the gameplay will appeal to everyone, but £1.99 it's excellent value.

**Tom Hussey**

*Morden's Quest* represents a stiff, long-term challenge with over one hundred and fifty locations and plenty of puzzles. A worthwhile addi-

tion to any adventure fan's library.

**Tom Hussey**

## TV's video magic

*Graham Taylor talks to some of the people behind the BBC's digital video effects*

**W**hen a celebrity on your TV suddenly shrinks in size, flips over, shoots off to the opposite corner and returns again as someone else, you may not, any longer, be surprised. But it's an effect that retains an ability to astound and amaze no matter how often it happens.

That computer generated graphics can be manipulated in surprising and logic baffling ways we accept. But when the image is 'real' like breakfast TV presenters or groups on *Top of the Pops*, we feel, if we do not actually say, "but that's impossible!"

The system for producing such effects is frequently referred to as Quantel, but this is like calling all medical plasters Elastoplast. This point was made by senior engineer John Mitchell when I visited the BBC and talked to some of the people who use the technology: "Quantel is only one of a number of devices we use which are all DVE machines" - that's Digital Video Effects.

All the machines store video images digitally and allow that information to be manipulated in certain relatively simple ways. All the twists, flips and shuntings about are the result of various combinations of squeeze, expand and position manipulations.

The BBC's armoury of video technology includes a Quantel 5001, Ado and E-Flex machines all of which turn an RGB video input into digital information and then allow you to manipulate it in real time. The machines vary, roughly, in two ways: what kinds of manipulation are possible and how many inputs are allowed.

The question of inputs is very important; it distinguishes, for example, between the manipulation of one image and the moving around, within the screen, several different images. For example, in *Live Aid* - the recent pop marathon - transmission was frequently switched between Philadelphia and London. The images from the US were often shown in a small rectangle in the bottom left hand corner of the screen; when Philadelphia was ready that small image expanded to fill the whole screen.

The job of actually creating such effects is that of a video effects supervisor - that is Danny Popkin's job and he explained how he would get involved in project. "It almost always starts with a director who comes to us with ideas of certain effects he wants to achieve and it's up to us to find out how best they can be done.

"The hardware comes with pre-programmed moves like shrinks and so on,

but often we need to create our own sequences of movement. A completed movement sequence can be stored in a bubble memory or a floppy disc for repeated use. Creating those sequences can be a complex business and required a fine eye for what looks right. Take, for example, an object that has to be made to fly in 'towards' the viewer, this involves combining an ever changing position with an ever growing size.

This is a facility that is theoretically provided within some of the systems - you place your object in a start location, mid-location and end location and the gaps in between are filled in by the system, to give a smooth movement. But it's often not that easy, as Danny explained: "Often the end result will simply not look right and the effect will be spoiled so you have to divide the complete sweep of movement up into a number of smaller sections, get the machine to do each one and then put all the sections together.

Using visual effects in programs can produce a whole host of problems to do with timing, particularly in connection with sound. John explained: "When these kind of effects are used, they can cause the sound to get slightly out of sync. Because of the

short time lag it's just enough to be noticeable and so we have to delay it - getting that delay right is a matter of experience and using your eyes and ears."

Experience, too, is required to know exactly how long an effect will last accurately enough to be able to use Quantel and the other devices on live programmes like the *News* and *Breakfast Time*.

Thus brings out another interesting point the visual wizardry is usually associated with flash up-tempo programs like *Doctor Who* and *Top of the Pops*, but it is used just as often, if not more so, in 'straight' information programs which are divided into a number of separate items. "It was actually the first use we put it to - it was a very good way of linking items."

If that kind of thing seems subtle in fact there are subtler uses still - as a sophisticated editing tool. "Even in serious dramas it has a use. For some technical reason it may have been impossible to do a long zoom-in on location. We can use the system to give the effect of a long camera zoom where there was none."

Danny's job is a complex mixture of artistry and hard technical knowledge. I wondered how he came to be doing it and indeed how anyone came to be working in the area of digital video effects "I started as a cameraman and

that's true of some of the other people as well, although others have an engineering background."

John added, "It's partly to do with the technology - it's a question of getting familiar with it. At first it tended to be engineers who struggled to integrate the machines. Now that that has been achieved people are used to the machines and the same skills are not necessarily required."

Danny summarised the ideal qualities. "You need some technical understanding in order to operate the machines and know their strengths and limitations but you also need some artistic skills like the ability to see what makes a good frame of picture and the best way to create a sequence of effects."

Latest developments in digital video effects systems include perspective manipulation. This means that your favourite rock band can now not only bounce around all four corners of the screen, turn upside

down and back to front but can also appear to hurtle off towards the middle of the screen as though disappearing into the distance. It's an amazing illusion that will probably be used a lot for the next few months before it really gets integrated with the other techniques available.

As John commented sagely "It's like anything - when you first get it it's like a new toy; everyone wants to play with it the whole time and it tends to be over-used. After a while people start using it more carefully."

All prices in £ sterling. \*Coming soon!

Here's what other people say about HiSoft Software:

#### Our Customers:

- C** "more addictive than any arcade game" H. Walker  
**Devpac80** "a brilliant piece of software" A. Brown  
**Ultrasit** "a great acquisition" J. Le Page

#### The Press:

- Pascal** "if you wish to teach yourself Pascal ... you won't go far wrong to buy HiSoft's Pascal" PCF 1/84  
**Devpac** "it is impossible to recommend any other development package for the Spectrum" ECM 4/84  
**C** "the most welcome addition to the Spectrum catalogue since Sinclair introduced the Microdrives" Sinc. User 12/84  
**Font64** "the manual is clear ... very simple to use" PCT 7/85

These are only a few of the glowing comments that we have on file showing that user and critic alike find HiSoft software offers a refreshing change of style.

We produce and market a wide range of high quality professional and well-documented software packages for the popular home micros. Our type of software is becoming increasingly more popular as people get tired of zapping aliens and want to put their brains to work learning new computer languages (Pascal, C, Devpac), investigating their computer's power (The Knife, The Torch) or being artistic (Font64); we have it all. Please feel free to write to us or phone for full technical details of any of our products. The above prices are fully inclusive and you can order directly from us or through your local computer shop.

Programmers: we are currently seeking to engage experienced programmers to join our team in Dunstable. Please contact Sue on (0582) 696421 for further details.

## Set tempo

**Hardware** Syntron Digidrum Micro Commodore 64 **Price** £65 **Supplier** Vince Hill Associates, 38A Grove Avenue, Muswell Hill, London NW10.

**T**he little black box and software disc of the Syntron Digidrum efficiently converts your 64 into a digital drum machine equivalent to a commercial unit costing around £250. Like these units, the Digidrum uses sounds "sampled" from real instruments, and so is devastatingly realistic compared to the typical boom-chicka-boom home organist's drum box.

The sounds are in fact defined in software, the module (which fits into the User Port of the 64) just acting as a digital-to-analog converter, and the unit will have an optional disc of seven new

sounds when it becomes available. The existing sounds are of very high quality and suffer little from background noise - the CBM64's Sid sound chip is not used in their production.

The main menu offers five options: Program Rhythm Line, Rhythm Track Composition, Set Tempo, Load Rhythms and Rhythm Track, or Save Rhythms and Rhythm Track. Program Rhythm Line (P) calls up a complex display of a single pattern up to 38 beats long, with the Rhythm Number labelled on the top left, the Tempo on the top right, and the seven available instruments listed down the right hand edge. These are C (Crash, Cymbal), O (Open Hi-Hat), H (Closed Hi-Hat), D (Drum, or Small Tom), S (Snare) and G (Grand Tom). The cursor keys are used to manoeuvre a pointer to the relevant beat, and sounds are inserted just by tapping the relevant keys. You can't play the Digidrum as a "live" drum kit, and in fact you can't even make a

single pattern repeat endlessly unless you write it into a "Track".

You can compose up to ten rhythms before going on to the Track Composition page. This consists of five columns into which you enter the pattern repeats you want (for instance, Pattern 1 x 4, Pattern 0 x 2, Pattern 7 x 1), and as soon as you're happy you press F7 to play

the track once or F5 to make it repeat. The T function allows you to define a new tempo from 1 to 64, and S/L allows you to Save and Load rhythms to and from disc along with one complete rhythm track. An impressive demo track is included and you can use Load in the middle of Track composition to bring in another set of ten patterns.

The Digidrum software has a few problems - it's difficult to break out of Track play mode, there's a pause between Track repeats and no way to get a disc directory other than in Basic. But the sounds - a very thumpy bass drum, excellent snare and good though short, cymbals, and rather bendy toms - are, on the whole, excellent.

For those wanting to link the Digidrum to other equipment, in addition to the jack audio output there's a phone Trigger Output which produces one pulse per beat and could be used to link up older sequencers or other drum units.

The Digidrum's well up to home studio recording quality, but it's also a fascinating toy. Very good value for money.

## Memory increase

**Hardware** QL Ram boards Micro QL **Price** £89.13 (64K), £135.13 (128K), £176.38 (256K), £313.39 (512K) **Supplier** PCML, Royal Mills, Esher, Surrey (0372 67282)

**W**ith disc drive systems and 'serious' software packages now on the market, the strain has been felt by the QL's 128K of on-board Ram (42K of which is gobbled-up by QDOS). In fact, the expression Peek-L(163840+16) - Peek-L(163840+12) - 512 (SV BASIC - SV FREE - space for one slave block) returns the true amount of user-available Ram which equals 87552 bytes on an unexpanded QL.

There are currently four manufacturers of add-on Ram boards - Quest Automation, Simplex Data, Medic Data Systems and PCML. Of the four, the Quest appears rather overpriced.

The PCML range includes 64K, 128K, 256K and 512K boards all of which use latest technology such that no extra pow-

er supplies are needed. The cards are all the same but use different combinations of memory chips.

I looked at the 256K Ram card, made up of just 11 chips, plus discrete components - eight memory devices, two address decoders and a special ULA-like chip which has been programmed by PCML to act as a memory controller. The circuit board has space for eight more memory chips to make up a 512K card.

The board, which measures approximately 98mm by 82mm, has been neatly designed and is compact enough to fit entirely within the QL's casing. Obviously, you will need a motherboard if you wish to connect both a disc drive interface and memory.

When you connect the 256K card, the physical memory is increased by 200% whilst the actual user-available Ram (calculated using the expression given above) is increased almost threefold. Also, the speed of programs - both SuperBasic and MC68008 machine-code - is increased by between 15% and 20%. This is because the QL's ULAs interrupt the main 128K bank of Ram in order to

display the video information. Any add-on Ram is not subject to this interference by the rest of the QL hardware. I ran a short machine-code program loop which took 124 seconds to run in the normal 128K bank of on-board Ram but only 105 seconds in the add-on Ram space.

The other obvious advantage of having 256K of extra Ram is that Microdrive operation will be more efficient. In particular, the Psion suite benefits greatly from this.

QDOS will automatically commission more memory for use as slave blocks. This means that if you Exec a program from one microdrive, execute another job, then Exec the original again without removing the microdrive cartridge, QDOS will remember that it has a copy of the program in Ram and will load that rather than examining the whole of the cartridge again.

If you do need more Ram for your QL the PCML cards seem like a good buy - they are well constructed and pitched at a reasonable price.

**Alan Turnbull**

## High contrast

**Hardware Print Technik Video Digitizer Micro Commodore 84 Price £145 Supplier CRL, CRL House, 9 King's Yard, Carpenters Road, London E15 2HD.**

**T**he Video Digitizer could be dangerous for those with a little imagination and an interest in computer art, because it takes you right into the high-cost world of video and digital picture modification. After half-an-hour's play with the Digitizer I was consulting my bank account to see whether it would bear the cost of a lightweight video camera.

Basically the Digitizer connects to the Commodore 84's User Port and allows it to interpret incoming video signals from

selection of printers. If you select "Digitize", the screen goes blank for about five seconds before the digitized version of the incoming picture is revealed; the definition is pretty low from complex colour pictures, but pictures with high contrast or in black and white come out fairly well.

There are just four levels of brightness available and these can be coloured using the Function keys. You can also go to 16 colour mode, which involves loading another routine from disc (which very pleasingly uses a fast loader). 16 Colour Mode allows you to assign any colour to each of 16 shades of grey, and the resulting picture can be accurately printed on a colour printer such as the Canon 1210, Epson or GP-700A.

Black and white printing on an MPS 801 or similar is very straightforward - though you can only see about two-thirds

list of stored pictures. You can arrange stored pictures for an automatic "slide show" using another software routine on the disc, and the Digitizer can also be used as an alarm system, comparing successive pictures and signalling if there's any significant change. There's a test pattern which can be used to adjust the contrast, brightness and colour values produced by the Digitizer and three small potentiometers accessible from the top of the unit allow you to alter these values while the unit is working.

One of the major uses of the Digitizer would be in examining and artificially colouring black and white pictures such as satellite photos of land masses. Arbitrarily chosen colours can reveal details in shades of grey which the human eye wouldn't otherwise detect, and these can be interpreted in many ways. For the more imaginative, the system gives the

a camera or video recorder. These should be straight video signals rather than composite picture/sound RF signals, although this isn't made at all clear in the four-side leaflet which accompanies the Digitizer and only became obvious through trial and error.

Loading the software leads to a menu in icon form which allows you to digitize a picture, view it on the monitor, store it to disc, store it to disc in an edited format for modification by the Koala Graphics Pad, or print it out on any one of a

of the digitized picture on the screen at any time, moving it around with the cursor keys, but the print function will always reproduce the whole scene. Storing scenes in Koala format (exactly as they're seen on the screen) gives you more versatility in this matter though, and you can also exit from the software without losing the digitized picture to apply your own software transformation.

Other Menu options include a light pen routine for operating the whole package and a *directory* command for a

possibility of transmitting pictures along the telephone network using a modem, and the possibilities for artistic applications are endless.

I enjoyed using the Digitizer enormously, but a more comprehensive and informative manual would have helped. I have few complaints about the software, which is very easy to use and the fast operation is a real bonus for the impatient video artist. Now, about that bank loan for a video camera.

# Luck of the draw

A drawing utility that produces its own Basic program -  
by A Mehmood

Many drawing utility programs offer you some very comprehensive drawing facilities which normally include drawing squares/triangles/circles, etc, and then filling them in, in a certain colour. However, the one thing that most of these utilities lack is the option to use the pictures in your own Basic programs, and many of those that do offer such a facility involve using vast amounts of memory.

This program offers two simple, but effective drawing facilities; the ability to draw straight lines or curves, and draw circles. It will also generate Basic instructions and load them into a Basic line, so that when you have finished your design you have a set of Basic instructions which will recreate the same.

Now the program can be activated to self-destruct and leave you with a Basic program which will draw your design on screen and take very little memory, and also offer you the flexibility of a basic program.

First Run the program. You will now be asked to select a paper colour, enter the required background (paper) colour. You will now hear a series of short pips, this is just to tell you that Cursor One and Cursor Two are on the same coordinates. At the bottom of the screen

will appear "Select Mode". The Select mode offers all the following facilities:

- 1) The cursors can be moved using the following keys when in select mode. Cursor One (small box) - 5 - Left, 8 - Right, 6 - Down, 7 - Up. Move Cursor Two (cross) using the above and 5/Shift.
- 2) Pressing A will allow you to change the ink colour and the over status.
- 3) Pressing G will draw/rub-out a grid on the screen.
- 4) Pressing I will allow you to see the present design stored in memory.
- 5) Pressing C until you hear a Beep will enter you into the circle mode.
- 6) Pressing U until you hear a Beep will enter you into the line/curve mode.
- 7) Pressing M will allow you to see the menu.

When in the Circle mode you have the following three options: Pressing 9 until you hear a Beep will return you to the select mode. Pressing S until you hear a Beep will store the circle drawn in memory. Pressing 2 will decrease the radius of the circle by one pixel, Pressing 3 will increase the radius of the circle by one pixel. (Cursor Two is the centre of the circle and Cursor One is ignored.)

When in the Line/Curve drawing mode you have the following three options: Pressing 9 until you hear a Beep will return you to the select mode. Press-

ing S until you hear a Beep will store the line/curve drawn in memory. Pressing 2 will allow you to decrease the curve by one, pressing 3 will increase the curve by one (the curve allowed is between -5 & +5). Curve 0 is a straight line. (NB. The line/curve is drawn from Cursor Two to Cursor One.)

When in any of the above drawing modes, pressing S until you hear a Beep will store the appropriate Basic command in memory; however, whilst the program is doing this there may be a slight pause after which you will be in the select mode. Should, however, the message "No More Room" appear it simply means that there is no more room in memory to store the command, therefore you should enter a Rem statement followed by approximately 128 characters after the last storing line used by the program (when storing commands the program prints a line number at the bottom of the screen; this is the number of the storing line currently being used).

Should you get an error when in the drawing modes because a line, circle or curve has gone off the screen simply enter Cls: Goto 1 and all will be OK.

When you have finished your drawing you can make the program self-destruct by firstly breaking into it and then entering Go To 7000. You will then be asked if you would like to self-destruct. Should you enter Y, there will be a slight pause and the main program will self-destruct leaving only your design in Basic lines for you to use in your own programs.

## Condensed text

Text compression made easy on the BBC B with a little help from Jeff Tullin

There is no doubt about it. Adventures are getting bigger all the time. Level 9, past masters at the art of creating huge adventures, surpassed even themselves when they created their 7000 room epic, *Snowball*.

What I wondered was - How do they do it? The answer lies in their methods of text compression, and over the next few weeks I will be showing you one way of coding text for use in your own adventures, which is fairly simple to use, and can, with care, achieve some very respectable results. (Even if not quite up to Pete Austen's awesome standards!)

This week I present the first of two 'squashing' programs. This one was written to run on the BBC, as does the final assembly language 'expander' program. However, I hope to show the principles involved sufficiently to allow users of other 6802 based machines (like the Oric and Commodore 64), to make use of the series. Next week I will print a 'squash' program which will run on Microsoft type Basics, and the following week will bring the 'expander'. The assembly language used in the 'expander' has very few machine specific calls, the main idea being that, once you have a method of squashing the text in the first place, the assembler will be easy to adapt to suit any 6802 machine.

But first, the theory. Regular readers of Tony Bridge's Adventure Column will no doubt be familiar with the method by which he gives clues to those

unfortunates who find themselves stuck in diverse dungeons and pits. A list of 'keywords' is given at the base of the page, and each is given a number. A typical list might be: 1) ogre, 2) jump, 3) kick, 4) up, and the clue would read something like: "3 the 1, then 2, 4," meaning 'kick the ogre, then jump up.' Substitution of words by numbers like this not only pleases those people who don't want any help by preventing them from seeing the answers accidentally, but it also saves a lot of space. This method of replacing selected words by a single number illustrates very well what the programs which follow are all about.

This week I want to concentrate on the actual squashing of the source text into its compressed form.

The first program, *Compactor* requires two things from you. The first is a list of phrases, words, or letter groups which crop up frequently in your texts. The examples held in the version printed here were for use in a 'castle' type scenario for an adventure I recently wrote. Obviously words like *castle*, *drawbridge*, *forest* and the like would not be of much use if you wanted to write an adventure about the Rebel Force battling against the Seventh Solar Empire, and this is where the work comes in. The 'dictionary' must reflect the most commonly used words in your own adventure.

As a general rule, a phrase/word/group of letters (in future I shall call this a

'token' or 'keyword') is only of value in compression if it occurs three or more times in your text. Only then can you actually claim to have saved any space. Words like 'the', 'I', 'you', & 'and' are sufficiently common to warrant inclusion in almost any dictionary.

*Compactor*, in essence, works through all the text (which you either type in or merge in as Data at the end of the listing), and replaces any words it recognises by a single byte. Then it stores it sequentially in memory starting at (in this example) &5200 together with the dictionary. In this way, for instance, eight or nine characters of source text can be replaced by only one character in the final, compressed version.

In order to allow you to use Teletext colour codes within the text, only ASCII codes greater than 136 are used to replace the tokens with. This gives us 119 values to play with, and indeed, the tokens in this week's program only total 100, so you can see that 119 is probably an ample amount.

The following notes are important:

- 1) To begin a new line at any time, include the character '#' in the Data.
- 2) A full stop in the Data heralds the end of a sentence, so the next lowercase character encountered after a full stop is automatically converted into uppercase by the expander routine. This is also true of the first letter of the text as a whole.
- 3) If using Teletext colour codes in the source text, always use quotes at the beginning and end, otherwise it looks very odd when you come to list it later, as these colour codes are interpreted by Basic as Basic keywords, and printed out in full as MOD or VDU, etc.

Next week, apart from the Microsoft type *Compactor* program, I'll present the flowchart for the 'expander' routines. In the meantime, happy typing!

```

# The hidden meaning

Predict the future with this expert systems developed for the CBM 64 by D F Murphy

**E**xsys enables a user to develop a set of rules, for prediction or for classification, from a previously built up file of observations (eg, past weather data). It does this by helping the user to discover patterns in the data, if any exist.

These rules are then applied to new data, which are decision factors, for which outcomes are unknown (eg, present weather), in order to predict the outcome (eg, tomorrow's weather).

The rules are developed interactively by being suggested by the user and tested by Exsys. The new data on which Exsys is giving probabilities for the outcome updates the existing file of observations. Thus a dynamic situation develops enabling the rules to be refined, due to the file continually changing.

It is important for the user to realise that the system works best with data which is linearly separable and relationships between variables are known and understood by the user. If this is not the case then Exsys will tend to operate inefficiently, which will be shown by low probability figures for forecast results.

You will find that Exsys may be used for prediction or classification in a wide range of applications.

This week we have printed part of the Basic listing, plus instructions for use of the program. Next week - the remainder of the listing plus a blow-by-blow dummy run.

## Instructions

**F1** - displays help screen

**F2** - new file routine which enables you to input the name of the file and the descriptions of each of the variate fields. Upper and lower case alphabetic characters, punctuation and numbers, are permitted. A maximum of 10 characters including spaces is allowed. 'Left-arrow' enables re-input. Input names, codes, or formulae to act as memory aids when inputting information in other routines. Return after each input.

**F3** - write data for future use, eg, if you have entered incomplete data (forecast data), for which results are not immediately available. It is best to write data after every use of Exsys. Keep separate data files for different subjects. If data is important then keep more than one copy of current file.

**F4** - read store data. Generally speaking this will be the data you have written with the above command (F3).

**F5** - input result of previously stored forecast data. Displays all forecast data codes as they were input and as passed.

This routine will only allow input of 1 or 0. When inputting results, data held in the data file is automatically updated and therefore when results have been input it is important to use the write (F3) command to save the data.

**F4** - this routine enables testing of the rulebase and is the heart of the Exsys system. The routine displays the rules and asks you which rule to test. You may test any rule. Exsys will advise you and display the 'systems efficiency' figure. It is up to the user to define the file and use the best combination of rules to increase system efficiency. Rules may be in the range:

$y > x$  (y greater than x)

$y < x$  (y less than x)

$y = x$  (y equals x)

$y ? x$  (y not equal to x)

y and x must be in the range 0-99 (integers only). y is the existing variate value in each sample, which has been input by the user, using the routine at F3. When prompted by Exsys to input the new rule for testing, you should input the relational operator (>, <, =, or ?) then press return, then input the number, (x), and press return again. Initially rules are set to '=0'. It is best to ignore Exsys advice at first, until a rule base has been built up, to 'get the system going'.

**F5** - this routine enables the user to input data for which a forecast is required. The code may be a name or a number or any combination of alpha numeric characters, up to 7 characters long.

The input under each heading, which corresponds to the variate names in the displayed panel, may be from 0 to 99 (integer values only). A maximum of 60

```

sets of data may be input and this may be split into pages as required by the user. The system will default to a new page after 18 sets of data on a page.

To select a new page press **F2**. The figure under **P%** is the probability of the result given the set of events represented by the data.

**F6** - this command enables you to print out data on a CBM printer. IEEE 488 printers as used on CBM business machines may be used with an Interpod interface. Output has been properly formatted for ease of use.

There is no need to use the 'Help menu' between commands and, subject to system restrictions resulting in error messages if illegal commands are given, the user may enter any routine from any other routine, which saves time.

The 'left-arrow' key enables the user to re-input a piece of data prior to pressing return. Pressing **Return** without any input will default the input to 0.

There are five system error messages:

1. **? results input required** - forecast data awaiting results, you may not change rules in this state.

2. **? insufficient data** - sensible calculations impossible, more data required.

3. **? no data for results** - you are trying to access **F3** but you have not read in file or input forecast data.

4. **? new file input required** - you need to read in a data file or call **F1** routine.

5. **? variate/result name required** - call routine **F1** as there is no description for the variate specified, or the result.

To save typing the program in, send **F3** to myself, D F Murphy, at Llanerch-y-Mor, Mairianglas, Anglessey, Gwynedd, LL73 8PA and I'll send you off a tape.

# THE GREAT AMERICAN CROSS-COUNTRY ROAD RACE

"I vote for Road Race. It's a tough choice. But I'd have to say that Road Race is now the best racing game on the market."

MILWAUKEE JOURNAL

"Cannonball Run on the small screen. This is one fun game. Activision have done it up right with sharp graphics and excellent play value to produce the most entertaining racing game ever for a home computer."

OREGONIAN

## NEED WE SAY MORE?

£9.99. Available now on C64 Cassette and Disk and Amiga Cassette and Disk. The Activision UK Ltd. 15 Harley House, Marylebone, Road, London NW1. Tel: 01-432 1415. From selected branch stores. With Special Machines, Dealer's Spectrums, Rumbos, W. Smith and good home computer software stores everywhere.

HOME COMPUTER SOFTWARE

## No restrictions

A sophisticated Input routine for a variety of program types from the keyboard of Jonathan Prestidige

If you have ever tried your hand at the odd data base or two, then you will probably know what a chore doing all that validation is. You might only have a few inputs in your program but once you have got down to the nitty gritty of making your program foolproof then you could end up with a monster of a listing.

Well, this monster of a listing is a procedure which does the bulk of the validation for you... but that's by no means its sole purpose. It does much to improve the appearance, user friendliness and power of your program for the user, and legibility of the program for you the programmer, since it takes just one command for one input allowing many features to be included.

I know the listing looks long (probably because it is!) but you only have to type it in once, and after that you can use it limitlessly in your programs. I use an input routine at work (which isn't nearly as flexible as this one) and I suspect many other professionals do too, because it offers the advantages of defining fields in a data base language with none of the restrictions.

Basic input statements also present restrictions; for instance you can't detect when a function or escape key has been pressed during one, whereas this rou-

tine automatically detects them and exits the input telling you which was pressed.

Before an input, the field is displayed with underlined characters (or a character that you can specify) to show the user just what is expected, length and format wise, giving it a professional look. Error messages are another thing the routine takes care of for you. One of the procedures best features is the way it displays the majority of the error messages instantly; if the user types in a character which is not allowed in that input or position then he or she won't have to wait until they press Enter to find out their error.

The Syntax of the command which calls the procedure is as follows:

Input - At line, column, format, [field], [ranges], [qualifiers]

Line is the line on the screen where the input will take place. Line is an integer between 0 and 23 (same as Basic AT statement).

Column is the column on the screen where the beginning of the field will be positioned; it must be an integer between 0 and 84 (same as Basic AT statement).

Format is (not surprisingly) the format of the field. Format is a string which consists of formatting characters (see Table One for their meanings). The format

characters are similar to those used in Cobol to define fields but there's many more to choose from. The data that the user types in will be restricted to this format for this input. For instance, if you want a field/input to be numeric only and have a maximum of three characters, then you would use the format string "999". For a field allowing letters only, the first letter being a capital and the rest lower case with a maximum length of 10 characters, you would use this string: "Aa99999999". The interesting thing about the formatting characters for upper and lower case letters is that they actually change the characters being input to suit their format... eg, if the user types a capital letter in a position that has a lowercase letter format then it will appear on the screen as a lowercase letter.

You can mix the formatting characters freely in any order. Some valid examples are: "A999", "11MMSC", "XMMMMMM", "EZZZ9.99", "99/Aaa/1299"... where the first three examples are straight forward and as described above. The other two use characters that you won't see in Table One, ie, the slash & pound sign. In fact, these characters will be displayed on the screen (and the same goes for any other character not in Table One). So the penultimate example will appear in the running program as: '\$\_/\_/' which is a very neat and easy way of doing things. The last example would appear in on the screen as '\_/\_/\_. Note that the user will not be able to type over these non-format characters.

More details and the rest of the listing next week.

```

# The Music Box

## Commodore music

**L**ast week I mentioned the Commodore 64's international importance. Proof of that, if it be needed, comes in the form of a book I have received from Italy called *Musica Elettronica Con Il Commodore* by Franco Fabbri, published in 1984 by Arti Grafiche Ricordi of Milan.

The title, of course, translates as *Electronic Music With The Commodore* and Fabbri - an Italian theorist of contemporary music and a publisher in his own right - is well-known for his contributions to the field of electronic music.

As a matter of fact, at around the same time as the Commodore 64 book was published, Fabbri produced a gloriously illustrated coffee-table book entitled *Electronics and Music*.

The 64 book, at least, demonstrates that this home computer can be considered a significant tool in computer music. I should say that Fabbri is looking for an English publisher for his book (he already has a translation), so if anybody's interested, they could get in touch with me.

The book is sold along with a cassette of the programs contained in the text, including a very effective sequencer.

Among the other programs are demonstrations of most of the Commodore's facilities, a synthesiser and a number of practical music programs.

All of them are extremely well presented and, assuming you can cope with the instructions in Italian, can be unreservedly recommended. The text itself is short and to the point of the Commodore

and Fabbri's programs.

The combination of book and programs on tape (or disk) is underexploited in this country. Fabbri's work is welcome from this point of

view alone.

Beyond the way in which the book and programs together illuminate the processes of sound synthesis, sequencing and so on, the programs themselves are of a uniformly high quality.

I will, of course, be happy to pass on letters to Franco Fabbri from anyone who wishes to get in touch.

Incidentally, my attention has recently been drawn to the existence of a computer music course at the City University in London. As yet, I have received no details of this.

If any *Popular* readers have experience of any courses in the field, I'd be most happy to hear from them and pass on any useful information to other readers through these pages.

Gary Herman

The Music Box is a weekly column with news, reviews and readers comments on all aspects of micros and music.

Any readers with experience of computer music making or companies with new product news are invited to write to drop a line explaining what they're doing to: Gary Herman, The Music Box, 12-13 Little Newport Street, London WC2R 3LD.

## TIPSTER SPECTRUM + /48 AMSTRAD CPC464/COMMODORE 64

The most accurate  
horse race predictor on the market

- ★ Tipster V2 took 18 months of trial and error before we arrived at the system that makes it the most accurate race predictor on the market.
- ★ Fully tested against other computer race predictors.
- ★ Tipster even performs better than the human tipsters from the top nine newspapers.
- ★ Many winners found at high prices.
- ★ For both flat and national racing.
- ★ The system will never go out of date.
- ★ We reveal the secrets of profitable betting.
- ★ Special tutor for the absolute beginner to racing.
- ★ Tipster also includes a program to calculate your returns for you.

If you can buy a more accurate race predictor we'll refund your money

Don't be tempted to buy cheap or inferior products.

£14.95

E. I. SYSTEMS  
PO Box 171, Wolverhampton, West Midlands WV10 6PJ

Leaves all other race predictors in the paddocks.

## POOLSWINNER

THE ULTIMATE POOLS PREDICTION PROGRAM

- **MASSIVE DATABASE** Poolswinner is a sophisticated Pools prediction aid. It comes complete with the largest database available - 23000 matches over 10 years. The database updates automatically as results come in.
- **PREDICTS** Not just SCOREDRAWS, but ALWAYS, HOMER and NO SCORES.
- **SUCCESSFUL** SELECT guarantees that Poolswinner performs significantly better than chance.
- **ADAPTABLE** Probabilities are given on every figure - choose as many selections as you need for your bet. The precise prediction formula can be set by the user - you can develop and test your own unique method.
- **SIMPLE DATA ENTRY** All transactions are in the program. Simply type in the reference numbers from the screen. Or use FIXGEN to produce figures list automatically (see below).
- **DISCOMMODATIVE COMPATIBLE** Tapes supplied with conversion instructions.
- **FRINTER SUPPORT** Full hard copy printouts of data if you have a printer.

AVAILABLE FOR Spectrum (48K), Commodore 64, VIC 20 (+ 1MB), AMSTRAD, BBC B, Atari (4MB), ZX11 (15K), Dragon, Apple II, ELECTRON.

PRICE £15.00 (all inclusive)

NOW AVAILABLE

FIXGEN 85/6

AT LAST! No more struggling to learn to get the fixture list into the computer. FIXGEN has been programmed with all English and Scottish fixtures for 1985/6. Simply type in the date, and the full fixture list is generated in seconds. Fully compatible with Poolswinner.

POOLSWINNER with FIXGEN £16.50 (all inclusive)

## COURSEWINNER V3

THE FUTURE COMPUTER PROGRAM

You can develop and test your own unique winning system by adjusting the statistical formulae, or use the program in simple mode. Coursewinner V3 uses a statistical analysis of major factors including past form, speed ratings, course statistics, prize money, weight, going, trainer and jockey form etc. It suggests most likely winners, good long odds bets, low odds, winners etc. The database includes vital course statistics for all British courses. You can update the database - never goes out of date.

AVAILABLE FOR Spectrum (48K), Commodore 64, BBC B, AMSTRAD, Atari (4MB), Apple II

PRICE £15.00 (all inclusive) includes Flat AND National racing versions.

**Book Castles and Kingdoms**  
Price £5.99 Micro  
Commodore  
84 Supplier Vir-  
gin Books, 328  
Kenal Road,  
London W10  
5XJ.

The great listing debate continues. I've never been a fan of books of listings; they usually seem a lot of effort for a little result.

Certainly Basic arcade games are a turn off, although a better argument can be made for adventures.

*Castles and Kingdoms* adds a new layer of sophistication for the type-it-in dragon-slayer as its 15 adventures are interlinked, each supported by a short introductory narrative. This framework of a unified world helps compensate for their necessary relative shortness.

Each adventure also has a somewhat different character from its neighbour.

It's a nicely produced book (no direct reproduction of dot matrix print-out here) in

large format and the price is reasonable, so if you don't object to all that time spent at the keyboard it's certainly one of the better volumes of listings.

John Minson

**Book Writing Educational Programs for the BBC and Electron**  
Price £9.95  
Micro BBC &  
Electron Supplier  
Macmillan  
London, 4 Little  
Essex Street,  
London WC2R  
3LP.

Of all the programs I see, the educational market contains the most turkeys, demonstrating the most basic programming faults (pun intended). Carlos and Harrison have set out to banish such ineptitude by enthusing - nay, evangelising - the cause of structured programming, making great use of the Acorn machines' procedure facilities.

What raises the book above being mere succession of

Def Proc's is its discussion of what's going on and the pre-planning necessary to produce a worthwhile educational program. It's sad, therefore, that the major examples fall back on old favourites like *Mathematical Invaders*. Lack of imagination is the other curse of this genre.

Somewhere in there, there's also a program packer; somewhere being the operative word because with so many useful routines it's ludicrous to omit an index.

Despite this it's a useful book. I only hope its effects show in future educational packages.

John Minson

**Book Programming in Micro-Prolog**  
Various Price  
10.00 Supplier  
Ellis Horwood  
Limited, Market  
Cross House,  
Cooper Street,  
Chichester,  
West Sussex  
PO19 1EB.

Micro-Prolog is one of the lesser known lan-

guages, not having had the publicity of Forth or Logo for home use.

Its specialities appear to be data handling and the demonstration of limited 'intelligence' in so doing, plus the ability to enter program logic directly, hence its name.

It's now becoming more readily available for a range of micros and while this volume concentrates on examples from the Spectrum version, most should be portable.

In fact, it's well supplied with demonstrations of how to put the theory into practice.

Obviously this hardback book is primarily intended as a school/higher education text and will be most valuable with tuition.

However, other experimenters or those with a dedicated interest in Artificial Intelligence, expert systems or other fields needing sophisticated list handling, will find this book at least worth looking at.

John Minson

## Mapped out

**A**s promised here is the solutions to the game *Entombed* by Ultimate for the CBM 64, thanks largely to Kenneth Devlin of Inverkip who finished it in the small hours of 9th June and drew the map. We also have to thank Marc Francois of London (finished on 22nd June), Gary Cleaver of Winkfield (21st June) and Stuart Shipp of Ashted (who has the strangest address I have ever seen and finished on 19th June). The tips are compiled from all of your letters and I am grateful to all of you for them.

The general feeling is that the game is superior to *Staff of Karnath*, with better puzzles, although it doesn't seem to have taken you so long to finish. The start location marked A on the map is also the finish, the exit is behind the statue on the left - once the chamber is left you cannot return until you have the Scroll of Thoth. This in turn is in a room that cannot be entered without seven other scrolls. There are 11 chambers, seven objects and seven levels and the exits to each one are through various protected rooms.

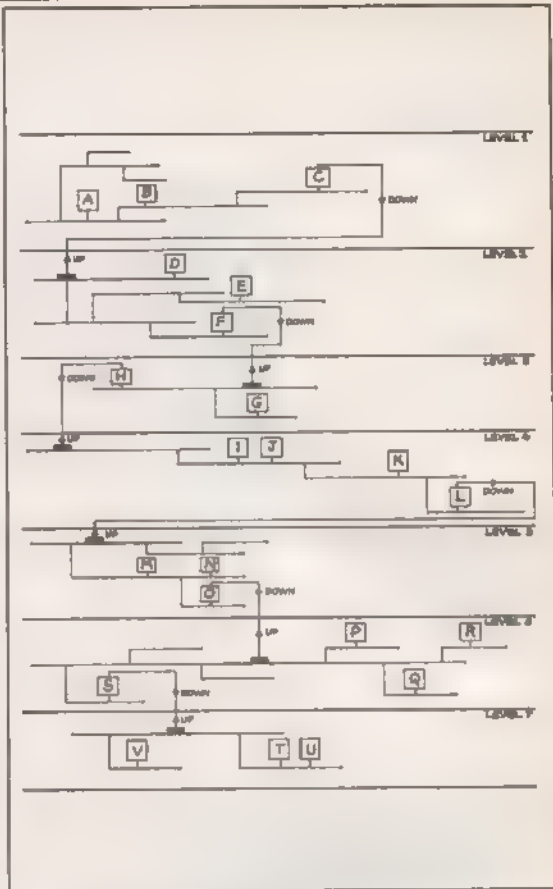

General tips - do not attempt chamber U, it is a dead loss (literally). In the corridors a falcon flies past carrying a cross - jump at it and strength is replenished. On level 7 if you walk past the crocodile room till it is off screen, turn back and enter you get extra lives.

**Exits to next level.** C dodge beneath the monster when it moves up. F stand on the left of the object and whip it out of the way. H - the statue will move if you have the idol from room G. L to move the boulder go up the ramp and jump up and down on the leftmost slab. O is the chamber of pools, the left one makes you visible, the middle invisible and the right zaps you unless you do it in the

right order, ie, left middle right left middle - you should end up able to go through the exit. S to get past the cobra you need the book of the dead. Walk towards the cobra, a grating falls and blocks your exit and the grating in front raises letting the cobra out. Go up the ramp towards the chest and all will be well.

**Objects.** B the whip. ■ the bowl of fruit - to get rid of the mummy get the Knot of Isis. C the small idol. K the book of the dead - to get it you need the bowl of fruit. Jump over the crack and walk to the plinth. M the lamp. Use the whip on these gongs in turn and notes should chime the music to *Close Encounters* - yellow, green, one below the yellow, middle, one below the green - a chest should appear - if you mess it up you must leave and start again. N - Knot of Isis - whip pots till they fall and statue will move. **Scrolls.** E jump the snakes. I when bird drops a jewel jump to catch it - a note sounds. Walk to right and put jewel in pot. The sun moves up, the moon and the pot move down. This has to be done seven times. J dodge under the first and last monster. N the chamber is dark - the torch ■ useful till you know your way about. P this chamber is dark with the same layout as E. Q in here you turn invisible - the layout is as N. T is dark with the same layout as J.

With seven scrolls a new room V appears - avoid the clouds, up the ramp and push the boulder to the edge and time it so that it falls onto the boat. If you miss, leave and re

enter. Take the scroll to the start.

Finally here is a cheat tip - **Load game.** If you are brave enough, reset computer by touching pins 8 and 2 of serial I/O port with a wire, see user manual (once again we disclaim responsibility if you do this and end up with fried

chips). **Poke 27840,98 (ret).** Sys 2560 to start. This stops the decrease in strength allowing you to practice. However, the chamber with the Scroll of Thoth becomes corrupted so you cannot finish the game unless you do it the hard way.

**Tony Keadle**

## We are searching for the top UK computer games player - the best there is!

The very best of Britain's game players will get to fight it out on a number of top secret new games - scheduled for release in the autumn.

### Here's how it works

Study the table below and look at the columns for the machine you have - these are the games you'll need to master. Send your high scores in on the form below, making sure that your scores are authenticated by a responsible individual signing the form. Any score achieved using technical short-cuts - such as *Infinite Lives Patch* - will not be accepted.

Between now and September Tony Keadle will be keeping you up to date on the *Arcade Avenue* page with just who has the scores to beat. Then, in September, the top three scorers on each machine will battle it out for a place in the final and the chance to be the first to play our 'top secret' games.

# Tony Bridge's Adventure Corner

## Eternal problems

**A**dventures are the same all over the world, and Craig Jopham from South Africa is one who suffers from the eternal problem - while we are slumped over the hot keyboard, our bodies quivering and red eyes bleary, others in the house are trying to lead a normal life around us.

He's worked on and completed a lot of adventures, but the Carnell/Mastertonic program, *Wrath of Magra* has finally brought him to a standstill. He's having trouble getting out of the first part of the adventure, which is a three-part game. The key to solving this problem, Craig, is to be found in *The Book of Shadows*, the thick tome that accompanies the tapes. I imagine that you have this book, even though Mastertonic tell me that they don't market the program in South Africa - obviously, you have the program! If you do, you'll have come across the runes on Pages 140-141, and these must be decoded in order to work round the various problems. I quite like the idea of having problems to solve outside of the adventure, for example in an accompanying book, as in this case.

First of all, get into the Wizard's Tomb (*Enter Tomb* will do nicely), and then read the runes on the sarcophagus. This will give you the password that opens the sarcophagus (oh, all right, it's *Kaju*). Now get the Wizard's Dust and make your way to Skull Cave. Here, you must throw or drop the dust and say another cryptic word (again, translated from *The Book of Shadows*), which is *Blaam*. This should get you into the second part of the program. In the second part, you must

nurse your strength and possessions, by doing simple spells such as *The Clay Man Spell*.

I realise that you won't see this for some time, Craig, but I hope you haven't exploded yet!

*Fantasia Diamond* from Hewson Consultants is one of the great adventures for the Spectrum. Peter Hill of Brierly Hill has noticed, by reading *Adventure Helpline*, that many people are having problems with crossing the River. This is very near the start, so obviously, the major part of the game is not available to many adventurers. There is a boat here, on the opposite shore. If you wait long enough, it will eventually drift across to you, and then you can use it. First of all, *Bons* must be sent over - wait again and the boat will re-appear, upon which you can cross the river yourself.

Hewson has a good catalogue of programs, mostly for the Spectrum - the other traditional adventure for which they are noted is *Quest*, while *Avalon* and *Dragonarc* are arcade-ish adventures which have brought them great success and which I believe come close to integrating the puzzles of text adventures with sophisticated animated graphics - though I think that both suffer.

Scott Graham says: "*Quest* is absolutely brilliant, but doesn't seem to get much coverage in the magazines, which is a pity. My problem is getting into *Castle Oops*. I know that you need the long key, but I can't find it. Is it beneath the trapdoor (I can't open that)? The scroll promised to give a valuable clue but hasn't yet - has the 'change' mentioned got something to do with the 'glittering walls'?"

You must have only just started reading *The Corner* in the last 12 months, Scott. The July 26 1984 issue contained a detailed dissection of *Quest* and this very problem was also covered in at least three issues before that! With so many wonderful new programs appearing almost every week, each one of which demands more space than we have, it is difficult to keep discussing older programs, good though they are. As you know, I try to keep interest alive in the more ancient games, partly for the sake of new readers, but mostly because I believe that adventures, unlike arcade games, never really date or show their age. To quickly answer your problems:

The long key is to be found in the low foothills, just south of the hubby goblin but it won't appear until you have dispatched the mindflayer. Now you can open the door to *Castle Oops*, but the words are rather unfairly obscure, and have held up many an adventurer - you must type *Open South*. To me, this is an example of the worst kind of 'word-matching'. Owners of *Fantasia Diamond*, however, will see that this very problem is covered quite extensively in the documentation. As for the cryptic scroll clue, just change the word *Slight*, geddit? *Quest* has always received a lot of praise from adventurers, not least because of its simplified version of *Dungeons and Dragons*-type combat, allied with the same sort of character-building. Thus, the player can choose to be a Wizard, Cleric, Rogue, Fighter or Simpleton, with the attendant attributes. Combat is achieved in much the same way as in *D* and *D* with dice totals and adds, and there is a host of spells to be used (in fact, the documentation spends so long on these aspects, that it finally has no room to explain the weird input requirements). Overall, though, a program well worth seeking out.

*System 1800* is an adventure from Craig Communications about hacking into a large Prestel-like database. It seems to have been quite successful and well-received, so a letter offering help may be of interest. Chris Jay writes from Bradford to say: "The main problem seems to be on the Selcra board. Log-on to the message board and leave the following message: *Selcra Vincheta* (incidentally, first withdraw the money from *Vincheta* and transfer to *Comdata*). Now log-on to the Selcra board (the password is *Arcles*, Selcra backwards), the ID code being 'V'. If you need more help, write to me, with a SAE, at 19 Lodge Gate, Denholme, Bradford, West Yorks BD13 4BB."

Tim Coxon has much the same advice, except to add: "The data on *Vincheta* can be used for Big Apple Investments by entering *Selcra*bigapple and 'b' for the ID on Selcra. Can anyone tell me what use *Silisy* data can be put to?" Tim is at South Coringlee Farm House, Harboles Road, West Chilmington, West Sussex.

Mike Richards offers help in *Urban Uptart*. Write to him at 8 Victoria Road, Roche, Cornwall. Robert Branch, a 14-year-old Spectrum user, would like a pen-pal with whom he can swap hints. He's completed the *Artic* series, *The Hobbit* and *Shepherd's Inferno*. As for *Snowball*, Robert, you must *Move Machine* to escape the padded cell. He's at 2 Woburn Avenue, Elm Park, Hornchurch, Essex RM12 4NG. Jens Danneschewski is from Bielefeld in Germany and is stuck in *Waxworks*. To block the trap door in the torture chamber, Jens, try *Fix Trap Door*. If you want to write to Jens, here's his address: Detmolderstr. 104A, 4800 Bielefeld, West Germany.

## Adventure Helpline

Going bananas? If you are stuck in an Adventure with nowhere to turn do not despair - help is at hand.

Fill in the coupon, explaining your prob-

lem, send it to us, and a fellow adventurer may be able to help

Remember - the system only works if those adventurers who have solved the puzzles get in touch. Every week is Save An Adventurer Today (SAAT) week!

# SUMMER SALE!

## PRINTER OFFER TATUNG TP80

We have a limited quantity of these superb printers at a special price. This is a similar model and from the same manufacturer as those sold under various names such as Shinwa, Mannesman Tally, Cosmos etc.

The print style is far better than most dot matrix printers in the price range because it uses square needles which give the print a "letter quality" look. Take a look at these samples of it's abilities.

**Standard Pica Text Pica Text Emphasised.**

**Condensed Text Condensed Underprint**

**ENLARGED TEXT**

**SUBSCRIPT MODE SUPERSCRIPT MODE**

**True descenders on ypg etc.**

**UNDERLINES NICELY**

There is no doubt that this printer is one of the best in it's class. At our special price it is without question a **Bargain**

**ONLY £179.95**

inc lead to suit '64, AMSTRAD or BBC

Or £199.95 with Kempston Centronics 'E' to suit Spectrum

**Other Printers in Stock - Call for details.**

## Now voting on week 36 - £25 to win

Each week Popular is compiling its own special software top ten chart - compiled by YOU.

And each week we will send £25 to the person who sends in, with their chart votes, the most original (witty, neat or clever - but never rude) phrase or sentence made up from the letters (you don't have to use them all) in the titles of the top three programs in this week's chart, published above.

You can still vote in the chart without making up a slogan - but you won't be in with a chance of winning the prize.

All you have to do is fill in the form below (or copy it out if you don't want to damage your magazine) and send it off to: Top 10, Popular Computing Weekly, 12-13 Little Newport Street, London WC2H 7PP.

Voting for Week 36 closes at 2pm on Wednesday July 31 1985. Entries received after that time will not be eligible for inclusion in that week's voting. The judges decision is final. Only one entry per individual per week will be allowed.

Name .....	My top 3: Voting Week 36
Address .....	1 .....
.....	2 .....
.....	3 .....
My phrase is: .....	

# New Releases

## ZAP AGAIN

As part of its Sparklers budget priced software range, Creative Sparks has released *Merlin* for the Commodore 64. I've seen this program before somewhere at full price although I can't remember who put it out. Certainly it looks fairly dated.

*Merlin* is a one screen zap game with you as wizard killing everything that moves and collecting spells to drop in a traditional style witches cauldron. The baddies not only whizz all over the screen crashing into you, but drop anti-spell parachutes that neutralise all the spells you've collected, forcing you to start all over again.

It's zap and zap again really, there's not a lot more to be said, standard sprites and OK sound effects - in short, an ideal budget game.

### Program *Merlin*

**Price** £2.50  
**Micro** Commodore 64  
**Supplier** Thorn EMI  
Thomson House  
296 Farnborough  
Hampshire GU14  
TNF

## CURIOUS BEAST

*Lands of Havoc* is a multi screen collect and dodge game that has been quite well received on a number of micros. It has also been released on then QL. As a QL program it is one of the best five arcade games available for the machine - but then look at the competition.

The idea is that you move a curious man/beast sprite

around a couple of thousand screens looking for various objects - each one giving a clue to the object that's required next. There are hordes of animals and monsters that materialise a couple of seconds after you enter each new screen (just like *Sabre Wolf*). The screen consists of pathways bordered by 'fences' of background illustration - castles, gardens, buildings (just like *Sabre Wolf*).

What the game does have, of course, is millions of screens. Personally I haven't yet found it compulsive enough to make me really relish that fact but the (Ultimate style) fold-out booklet suggests that all sorts of exciting things await me. I have my doubts, but the fact remains that *Lands of Havoc* is probably an essential purchase if you are a games starved QL player.

### Program *Lands of Havoc*

**Price** £19.95  
**Micro** QL  
**Supplier** Microdeal  
41 Truro Road  
St Austell  
Cornwall PL25 6JE

## FUEL STOP

The *Great American Cross Country Road Race* is another road racing game like *Pit Stop* and more particularly *Turbo*. It has the basic design of all such games, triangular shape road representing perspective and odd objects scrolling towards you on the road borders. Your car is represented by a dashboard with controls at the bottom of the screen and other cars are rear views in sprites - the effect is reasonably good but nothing special.

The additional elements to whizzing along as fast as possible without crunching your car are a map of America from which you plan your journey, traffic cops who set speed traps and a strategic element where you must bear in mind types of terrain and the frequency of fuelling stops.

The trimmings make for a slightly more strategic road race game than most and that may be important to you. In essence though, there isn't anything particularly exciting

or original here.

### Program *The Great*

*American Cross-Country Race*  
**Price** £9.99  
**Micro** Commodore 64  
**Supplier** Activision  
15 Harley House  
Marylebone Road  
London NW1

## INGENIOUS

*Timeslip* is possibly the best C16 game I've yet seen. It's wonderfully ingenious - a sort of three tier *Scramble*, the top third of the screen involving you piloting a spaceship, the next being a rocket man and the third controlling a submarine.

Each section is attempted individually - you have to dodge the obstacles and destroy evil Time orbs. Each works as a fairly nifty *Scramble* variant. Graphics are good by current C16 standards, as are sound effects.

The timeslip element derives from the fact that to complete the game all the zones must be in sequence - they get out of sequence if you get blasted more than a certain number of times and must be resequenced within a certain time limit.

Wonderfully addictive, ingenious and a must for C16 arcade addicts everywhere.

### Program *Timeslip*

**Price** £7.95  
**Micro** C16/plus 4  
**Supplier** English Software Company  
1 North Parade  
Parsonage  
Gardens  
Manchester

## STOPPING AT ...

There was a time, I am reliably informed, when men were men, bobby-socks were in, and the dream of every little boy was to become a train driver.

Ah, the romance of the footplate, the rushing by of stations, the freedom of the track, the bad pay, the lousy working conditions... not the most promising idea for a high-tech computer simulation you must admit. Yet, striking a brave blow for originality, such a program has just been released by those old warhorses Hewson, in the shape of *Southern Belle*.

Written by Mike Male (author of Hewson's *Heathrow Air Traffic Control*) and train buff Bob Hillyer, this could be easily written off at first glance, as a quirky, but hideously over-complex, piece of software. This is far from being the case.

The instructions - and there are plenty of them - are well set out and clear. The game options are also well thought out and numerous enough to allow novice or expert to enjoy the trip from Victoria to Brighton riding the King Athur class 4-6-0 loco.

There is a choice of five control options (from 'stop and go' to 'Blower, Damper, Fire, and Injector') and seven trip options from auto demo through record breaking attempts to commuter stopping trains.

At the end of the run, (if you get that far), you are given a percentage for Efficiency, Timekeeping and Safety, plus an overall rating.

Played in real-time (although you can speed it up), the line graphics are adequate and the instrument display well designed.

Make no mistake about it, this program has a persuasive charm that will soon have you hooked.

Got to be a hit.

## PRICED OUT

*Cuthbert in Space* is another one of Microdeal's QL games issued at the same time as *Lands of Havoc*. That someone is doing games for the QL is something QL owners ought to be glad about - but this is a dreadful game that would barely make it as a budget program on the Spectrum. On the QL it costs £14.95.

Now I wonder about this pricing: certainly it isn't unusual for a QL program and I appreciate that there are duplication problems and that Microdeal is catering for a smaller market than with Commodores, Spectrums and Amstrads, but I really think it's too much (microdrives are under £2 now, probably much less in bulk) and there isn't that much competition on the QL - so why £14.95? Probably simply because that's what can be got away with.

Back to *Cuthbert*. Collect the egg shaped things, dodge the simple sprites then collect the falling objects, and so on.

All one screen and graphics that make the Spectrum look good (well, better anyway.) Despite the dearth of games software for the QL, this is not one for your collection.

**Program** *Cuthbert in Space*

**Price** £14.95

## TRADE OFF

*Pegasus* is an adventure from Herron Software. It is a text adventure, not Quilled, not in machine code and it costs £6.50.

That makes it well above the price of similar programs and as such it ought to have something unique to offer. What it is, being generous, is a reasonably well designed goblin basher with trading and fighting elements.

For Basic, response times were pretty good and the locations nicely descriptive. Nasty creatures started leaping out at me almost from the beginning so you could also say it's fairly action packed as well.

The problem is simply that all this would be fine at a couple of pounds, but £6.50 is simply too much - there just isn't enough to the program. The other problem, common in Basic, is that it's rather easy to break into the problem - this could be infuriating if you did it accidentally at a late stage in the game.

If you're an absolute no holds barred adventure nut then this is a maybe, if not there are plenty of other,

Pick of the week

## SOPHISTICATED

Vortex have been making addictive 3D games for a long time while now - worth pointing out because a lot of people are going to say that *Highway Encounter* looks an awful lot like an Ultimate game. So it does, and there's no way the author of *Highway Encounter* hasn't seen *Knight Lore*. Nevertheless it's a technically superb, thoroughly addictive game with plenty of original touches.

To visualise *Highway Encounter* imagine a lateral *Knight Lore* - your view of the map stretching over several screens from bottom left to top right, rather like *Zaxxon* but with the screen scrolling on only when you reach the top right corner rather than continuously.

*Highway Encounter* takes some of the Ultimate ideas of 'solid' 'usable' objects which can be shunted around to make a sophisticated strategic zap game rather than the judgement/timing challenge of *Knight Lore*.

The idea is this, a team of five little robots called Vortons must push a little 3D diamond shaped object over more than 30 screens. One robot is under your control,

the others follow each other along the centre line. Each screen has different horrors and different possibilities for action. Nasties include eyeballs, vicious venus flytraps, indestructible sparks and little space ships. Some follow set patterns and can be blatted relatively easily - some of them come for you.

There are also a number of objects scattered around which may be used as a barricade or to block in the indestructible baddies. Pushing or blasting them into the right position is a matter of some thought and planning - a nice

cheaper, choices around.

## ZAP

balance to the 'blast the baddies' element.

After some disastrous first tries I realised that blasted baddies stay blasted and trapped aliens stay trapped - for this reason the best technique is to block up your diamond shaped object and spare robots and then go ahead alone killing as much as possible and using objects to block in the baddies you can't kill. Then, theoretically, you can unblock your diamond and other robots and make one dash for it to the end.

My single worry about the game is that it may prove too easy. After grasping the above idea, I've got fairly close to clearing the way for a run through to the final zone - that's after around six plays. Still, it may still be a hell of a lot more difficult than I, smugly, think.

**Program** Highway  
**Encounter**  
**Price** £7.95

teaches how to read various kinds of graph and how to construct one from a set of data. It works by both presenting information and then asking questions about it.

Most important of all for this kind of package, it appears to be completely error trapped - I couldn't make it crash no matter how hard I tried. The pace of learning is obviously something that is difficult for a non-13 year old to judge, but I'd have said it was just the right balance of reiterating new information and introducing new ideas.

Certainly one of the best educational packages I've seen - particularly welcome on the Commodore 64 which does particularly badly in the range and variety of the educational software available for it.

ery of subjects for ages three to 13. Many of the packages form a sequence growing in age range and sophistication, eg, *Multiplication II* is followed by *Multiplication III*.

*Graphs II* is a package aimed at 10-13 year olds and

## ORIENTAL

*Way of the Exploding Fist*, Melbourne House's mega Karate simulation, has been responsible for, amongst other injuries, more sore throats (caused by the hysterical scream of Yeeehaaaarrrr aaarghhh at appropriate moments) than any other computer game.

*Chop Suey* from English Software is more oriental viciousness of the kicking and punching variety. This time it's Kung-Fu and it runs on the Atari machines with 48K or more.

The settings aren't as exotic as the gardens and temples of *Exploding Fist* but the graphics of the central fighters kicking each other's brains out seem nearly as good.

Good to see, also, that the program is home grown - ie, programmed in the UK. The current prices of the Atari machines make them absurdly good value and they deserve that kind of support.

**Program** Chop Suey  
**Price** £8.95  
**Micro** Atari  
**Supplier** English Software  
1 North Parade  
Parsonage  
Gardens  
Manchester

## ON THE WARD

*St Crippens* is a weird Spectrum game which forms part of the Sparklers series of budget games. Graphically this one is a bit disappointing; it's a rather dull looking (mostly two colour) affair with simple line graphics as background.

It gets a few Brownie points for wackiness of plot though. You have been admitted to St Crippens, the worst hospital in the world, and have to get out before something dreadful happens to you, like death for example. This involves running around lots of hospital orientated screens picking up useful objects like clothes whilst being chased by a collection of doctors, nurses and mutant thungies from the Genetic Engineering Lab.

The worst aspect of actually playing the game is the naff collision detection - it seems that you can be 'nabbed' from several yards away, which makes getting caught fairly arbitrary. Unless the vaguely amusing plot appeals to you, I wouldn't put this on your list of must buys.

**Program** St Crippens  
**Price** £2.50

## Questions, questions

**W**hat is a computer? How is the Intel 8086 chip like the radio programme *Twenty Questions*?

In *Twenty Questions* 20 questions are asked, to each of which the answer is (in theory) Yes or No. There are two alternatives, and so with 20 sets of two alternatives there are  $2^{20}$  possible outcomes.  $2^{20}$  is equal to 1048576, or (in computerese) 1M. The Intel 8086 chip has a 20-bit pointer to address locations, so that the address range is  $2^{20}$ , or 1048576, or (in computerese) 1M.

This is the answer to the second question: both *Twenty Questions* and the Intel 8086 can point to 1M different items. This is also the answer to the first question: a computer is a machine which acts by combining sets of two alternatives (when it operates digitally). A computer is a device for combining information.

If  $S$  is the number of different possible states, and we do not know beforehand which of the possible states is likely to occur, then the information content ( $I$ ) of the states is given by

$$I = \lg_2(S)$$

where  $\lg_2$  represents the logarithm to base two, and the units of information are sometimes known as Shannons (after Claud Shannon, one of the inventors of information theory). The information content of 1048576 different states is thus:

$$I = \lg_2(1048576)$$

$$= 20.$$

The information content needed to describe 1M different states is thus 20 Shannon, or 20 questions, or a 20-bit pointer. The information content of 100 different states is thus  $\lg_2(100) = 6.64$  Shannon. This means that to discern the size of an integer between one and 100

will require seven questions of the nature "Is it higher than this value? Since one Shannon is equal to one bit, and as it is impossible to have 0.84 of a bit, in the case of establishing the correct number from 100 ordered alternatives, sometimes it is possible to get the correct answer in six attempts, more often it takes seven attempts. On average, assuming an optimal strategy and evenly distributed numbers, it takes 6.64 guesses. The Shannon is simply an average.

Information theory does not deal in absolutes, it deals in averages - in expectations - and the averages are bit information known as Shannons. The correspondence between bits and information content is quite powerful, because it enables us to realise that the information content of a byte is eight Shannons. The potential information content for an Intel 8086 is  $20 + 8 = 28$  Shannons (or  $\lg_2(1048576 \times 256)$ ). That is, it is possible to distinguish between all the  $1048576 \times 256$  different states of an Intel 8086 computer by asking 28 simple (Yes/No) questions.

I have noted above, computers are information manipulation devices, and the basic unit of information is one Shannon (or one bit for a digital machine). Computers are more flexible than any type of machine for this reason: in general, machines manipulate raw energy, and do not manipulate anything which might be termed 'information'. Many machines have a great flexibility in that they can be in many different states, but these states have little or no information content. For a set of states to have an information content, the transitions between the states must not be predetermined.

The reason why I have emphasised that one Shannon is effectively equivalent to one question is that the idea of questioning is something we can readily understand.

Computers are information manipulators, but we can exhaust the limits to the variation in their information by just a few simple questions. For how many human enterprises is this true?

**Boris Allan**

## Building bricks

### Puzzle No 167

I was watching my young nephew the other day building with his toy bricks. He was building piles of bricks of various sizes, but always either a single brick, or a larger pile comprising a complete cubical arrangement. At one point, I noticed that he had three piles of bricks, as shown.

There was a single brick, then next to it was a  $5 \times 5 \times 5$  arrangement, and finally a third pile with three bricks along each edge. Each pile was complete, and I calculated that in the three piles there was 183 of the individual bricks - a number that was curiously reflected in the numbers of bricks along each respective edge.

Assuming that he had unlimited supply of bricks, what is the next largest set of three cubical piles that has this unusual property?

### Solution to Puzzle No 163

The shortest route is 238ft. 0" and the height above ground at which he should go round the back of the wall is 18ft. 0".

```
10 LET S=35.355
20 LET T=100*15
20 LET O=1055
20 LET H=8
20 FOR N=1 TO (S*(2))
60 LET X=SQR((H*N)*((100*(2))+(100*(2)))+(SQR((19+
100)*12*(S+100)*12)+(S*(12-N)*(15*(12-N))))
70 IF X<O THEN LET O=X:H=N
80 NEXT N
90 PRINT "SHORTEST DISTANCE IS "O/12;" FEET"
100 PRINT "AIMING FOR A POINT "H/12;" INCHES FROM
THE GROUND"
```

The height of the fly above ground level is easily found to be 35.355ft. (The side of a square having a diagonal of 50ft.) Consequently, the fly is 138.355ft from the edge of the wall.

### Winner of Puzzle 163

The winner is T Markham of Frampton Cotterell, Bristol, who receives £10.

### Rules

The closing date for Puzzle No 167 is August 21.
